

## ABSTRACT OF DISCLOSURE

A system for reproducing a subtitle from an optical recording medium and a method thereof. The system reconfigures a subtitle menu during reproducing data from an optical disc and selects the reconfigured menu in order to play the optical disc. The method includes selecting a play menu from the optical recording medium to be played, reconfiguring and storing menu execution information, and executing the play menu previously reconfigured whenever playing the previously played optical disc or a newly played optical disc. Once a setup menu is reconfigured before or during playing of the disc, the previously configured menu is applied when the optical disc is played again or a new optical disc is played.
